EXA: Sequential Biorevitalization™ for the Treatment of Chrono- and Photoaging

Specifically formulated for mature skin, **EXA** is the line designed to counteract the manifestations of intrinsic and extrinsic aging. The protocol targets tissue **ptosis, dyschromia, and alterations in skin trophism,** restoring vitality to tissues with a deficit of hydration and essential nutrients; this ensures a visible improvement in skin firmness, elasticity, and overall skin well-being.

The scientific core of the line, the patented **Oenanthe extract**, is a lifting active ingredient that delivers an immediate recovery of skin tension.
The formula is enhanced by a complex of **polynucleotides, biomimetic peptides, and hyaluronic acid**, which work in synergy to:

INDUCE ENDOGENOUS BIOSTIMULATION:

activating fibroblast metabolic response.

RESTORE THE EXTRACELLULAR MATRIX:

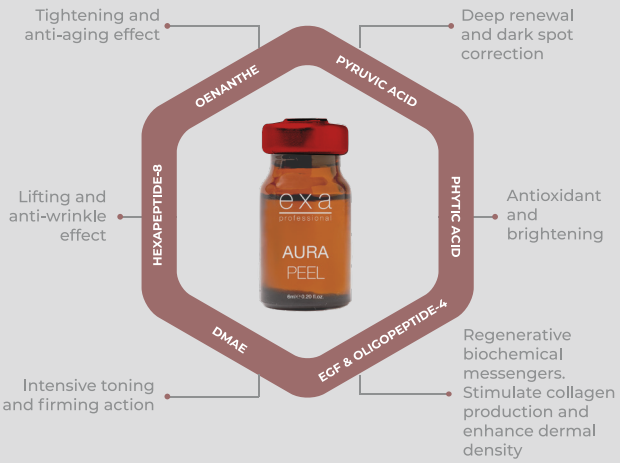

improving dermal density and structural support.

OPTIMIZE CELL TURNOVER:

counteracting dullness and pigment irregularities.

EXA: Sequential Biorevitalization™ for the Treatment of Chrono- and Photoaging

MAIN INGREDIENTS
All in one solution

AURA PEEL cod.70290

Designed to restore tone and firmness and to revitalize the endogenous synthesis of collagen and elastin, it delivers a powerful anti-aging effect.

It contains Oenanthe extract (Patent No. RM2013A000200) which, thanks to its unique active molecules, is able to induce a skin-tightening effect and counteract skin ptosis. The acids within the formula (glycolic, pyruvic, mandelic, and fruit acids) smooth the skin and maximize the penetration of active ingredients.

Hexapeptide-8, known as a 'botox-like' peptide, and DMAE work in synergy to combat wrinkles and signs of aging, revealing smoother, more radiant, and toned skin.

AURA BALANCE cod.70552

Biorevitalizing solution ideal for the treatment of mature skin, thanks to its rich complex of active ingredients with multiple actions: biostimulating, hydrating, antioxidant, plumping, and smoothing.

It contains hyaluronic acid, renowned for its plumping and hydrating properties, and polynucleotides—specifically Sodium DNA—which, together with amino acids, stimulate fibroblast activity for a regenerative action.

Hexapeptide-8 (known as the botox-like peptide) counteracts expression lines and tissue sagging, while dipeptide-10, in synergy with resveratrol, provides a powerful antioxidant effect
